1. INTRODUCTION

1.1. Instructions and Brief

- 1.1.1. Tree-space has been instructed to undertake a tree survey and arboricultural impact assessment for a proposed new cycle route between the villages of Kill and Johnstown in Co Kildare. The proposed cycle route is to provide new segregated cycle infrastructure and upgrade the existing infrastructure along the L2014 between Kill and Johnstown.
- 1.1.2. The report addresses the scope of works set out in the tree survey brief (Document Ref: 40000089-WSP-HW-0002) provided to Tree-space by WSP Ireland Consulting Limited. The field assessment was completed between the 13th and 16th of December 2021. The following documents were provided to Tree-space to inform the tree survey and report:

Table 1: List of drawings to inform the tree survey and report

Document Title	Document/Drawing Number	Originator
Extent of the tree survey	40000089-WSP-DG-HW-0001 (Rev-L02)	WSP
Topographical Survey	MSL12557_3DM1-ING (1,2 & 3)	MS
Proposed Route Layout	Not known	WSP

- 1.1.3. The report should be read in conjunction with the following Tree-space plans:
 - Tree Constraints Plans: TS TCP 20 12 21 (sheets 1 5).
 - Tree Assessment Plans: TS TAP 31 12 21 (sheets 1 5).
 - Tree Removal & Protection Plans: TS_TPP_16_02_22 (sheets 1 5).

1.2. Aims and Approach

1.2.1. The purpose of this assessment is to quantify and categorise the arboricultural features on the site and assess the potential constraints to development. Trees are a material consideration for local authorities and tree owners. Whether they have statutory protection or not the potential impacts of construction must be considered. Construction activities often exert pressures on pre-existing trees and in some cases trees that have taken decades to mature can be damaged irreparably. The assessment and implementation of protection measures is therefore critical to mitigate against any potential negative impacts.

1.2.2. The arboricultural impact assessment was carried out in accordance with the British Standard BS 5837:2012 Trees in relation to design, demolition, and construction – Recommendations¹. The British Standard sets out the principles and procedures to be applied to achieve a harmonious and sustainable relationship between trees and structures. The assessment process undertaken for this report is described in table two below.

Table 2: Arboricultural Impact Assessment Process

TASK	DESCRIPTION
Topographical survey	Record the position of all trees within the site with a stem diameter of 75mm or more, measured at 1.5m above highest adjacent ground level.
Tree survey	Collect relevant information on all trees included in the topographical survey, as well as any that might have been missed. The parameters of the tree survey are set out in BS5837:2012 section 4.4 and are described in more detail in appendix 2 of this report.
Tree categorization	Identify the quality and value of the existing tree population. The categorization method set out in table 1, BS5837:2012 allows informed decisions to be made concerning which trees should be removed or retained in the event of a development occurring. The tree quality assessment table is included in appendix 2 of this report.
Impact assessment	Identify the requirements for the successful retention of the retained trees and detail the measures necessary for protection during the development process. Root protection areas (RPA's) are calculated in accordance with section 4.6, BS5837:2012. The RPA is the minimum area around a tree that needs to remain undisturbed to maintain the tree's viability. The RPAs of each categorised tree will be plotted on relevant scaled drawings.
Tree protection plan	The tree protection plan indicates the precise location of the protective barriers to be erected to form a construction exclusion zone around the retained trees. The plan will be superimposed on the layout plan, based on the topographical survey.
Arboricultural method statement	Address some or all of the following: Pre-development tree works, site supervision, protective fencing, ground protection, boundary treatments, services and drainage, and monitoring.

¹ The British Standards Institution (2012) *Trees in relation to design, demolition, and construction – Recommendations.* BSI Standards Limited.

1.3. The Limitations of the Report

- 1.3.1. Only those trees specified in the scope of work were assessed. The observations that were made are limited to the requirements of planning and development. The survey is not a tree risk assessment.
- 1.3.2. The trees were visually assessed from ground level only. No climbing inspections were carried out. No invasive or other detailed internal decay detection devices were used.
- 1.3.3. Where trees were not recorded on the topographical survey, their positions have been plotted manually on the drawings and cross referenced using aerial imagery. The positions of these trees should be treated as approximate only.
- 1.3.4. The conclusions relate to the conditions found at the time of survey. Trees are living organisms that are subject to the stresses of climatic extremes, decay fungi and injurious diseases. There is no warranty or guarantee, expressed or implied, that problems or deficiencies of the trees in question may not arise in the future.

2. THE SCHEME

2.1. Description of the Scheme

2.1.1. The cycle scheme comprises of new bidirectional cycle track and shared paths along an approximately 4.4 km route between Kill and Johnstown villages. The bidirectional cycle path will run along the southern edge of the existing road carriageway. The path will transition into shared use areas on the existing footpaths along the route. Spatial

2.2. Scope

- 2.2.1. The tree survey targeted the trees within the red line area defined on the Tree Survey Boundary drawing (drawing ref: 40000089-WSP-DG-HW-0001). Where trees were established on adjacent lands outside the red line boundary but had the potential to be impacted upon, these trees were included in the survey.
- 2.2.2. The areas that were assessed are divided into two sections in Johnstown village and Kill village. The Johnstown section begins in the west of the village close to the roundabout on the R445. The section continues for approximately 800m to the east of the village where the land use changes to agricultural grazing.

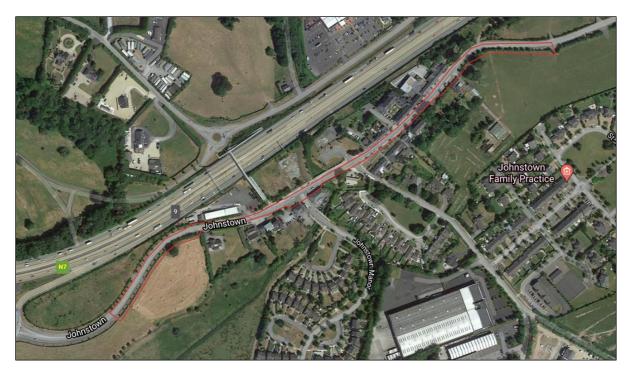

Figure 1: Aerial image of Johnstown village with the approximate boundary of the tree survey area outlined in red. The survey for this section began at the edge of the red line in the far left of the image. The tree numbering begins at this point on T615 and finishes in the east of the village on T681.

2.2.3. The Kill section of the survey begins west of the village at the entrance to Embassy Manor. The survey area continues to the east through the Main Street in Kill for approximately 1200m. The survey area finishes in the eastern end of the village close to the entrance to Earls Court.

Figure 2: Aerial image of Kill village with the approximate boundary of the tree survey area outlined in red. The tree survey for this section began at the edge of the redline in the far left of the image. The tree numbering begins on TG682 at this point and finishes in the east of the village on T803.

3. THE TREES

3.1. General Description of the Trees

- 3.1.1. In total 188 individual trees and 5 tree groups were assessed for the project. The total number of trees including all the individuals in the tree groups is 238. The trees are established in narrow grass verges alongside the pavements and road edges. The canopies of the trees often extend over the pavement and road well above head height.
- 3.1.2. Twenty-six different tree species were identified along the route. The two most common species are ash and hornbeam, together accounting for 38% of the surveyed population. Eighty percent of the surveyed trees were in the young to early mature life stage. There is a very high proportion of the trees (91%) with good physiological condition. This is directly related to the high number of trees in the early stages of their life cycle.
- 3.1.3. Four trees were classified as being in the late mature stages of their life cycle. Two of these trees are old beech trees. One is established in the graveyard in Johnstown

village and the other in the churchyard on the Main Street in Kill. Using the method of White² the estimated age of the beech tree in Johnstown graveyard (tree number T640) is 160 years old and approximately 280 years old for the beech tree in the churchyard in Kill (tree number T761). Both trees are very prominent in the landscape, they have high amenity value and historic cultural significance. An image of each tree is included in the photographic summary in appendix 5 of this report.

3.1.4. Fifty percent of the surveyed population were classified as category A (see tree categorization table, appendix 2). The other fifty percent were classified as category B or category C with the highest proportion in B. The structural condition of the trees was good to fair with only four percent being in poor condition.

3.2. Tree Population Analysis Tables

3.2.1. The following tables present an analysis of the surveyed tree population. The analysis includes all the individual trees and the individual trees within the tree groups.

Species	Count	Percentage
Ash	46	19%
Hornbeam	45	19%
Silver Birch	36	15%
Large-leaved Lime	23	10%
Common Beech	20	8%
Leyland cypress	11	5%
Norway maple	10	4%
Rowan	7	3%
Sycamore	7	3%
Himalayan Birch	5	2%
Lawson cypress	4	2%
Whitebeam	4	2%
Cherry	3	1%
Copper plum	2	1%
Tree Cotoneaster	2	1%
Chusan Palm	2	1%
Cedar	2	1%
London Plane	2	1%
Hawthorn	1	0%
Grey willow	1	0%
Wych Elm	1	0%
Plum	1	0%
Monterey Cypress	1	0%
Apple	1	0%
Horse chestnut	1	0%
Grand Total	238	100.00%

Table 3: Tree species list with count of individual trees per species and percentage of the total.

TREESPACE

6

² White, John (1998). *Estimating the age of large and veteran trees in Britain*. Forestry commission.

Life-Stage	Count	Percentage
Young	36	15%
Semi-mature Semi-mature	98	41%
Early mature	57	24%
Mature	43	18%
Late mature	4	2%
Total	238	100%

Table 4: Count of life stage with percentage of the total.

Remaining contribution (in years)	Count	Percentage
<10	0	0%
10-20	35	15%
20-40	75	32%
40+	128	54%
Total	238	100%

Table 5: Count of remaining contribution in years with percentage of the total.

Retention category (BS 5837)	Count	Percentage
Α	119	50%
В	84	35%
C	35	15%
Total	238	100%

Table 6: Count of the number of trees in each retention category with the percentage of the total.

4. ARBORICULTURAL IMPACT ASSESSMENT

4.1. Tree Loss to Facilitate Development

4.1.1. The table below describes the trees that will be directly affected by the proposed cycle scheme. The impact for each individual tree is described in the Johnstown section and Kill section of the cycle route.

Table 7: Direct Loss of Trees and Tree Groups.

Tree No	Tree Species	CAT <i>BS5837</i>	Description of Impact
Johnstown	Section		
T629	Fagus sylvatica Common Beech	C2	Direct conflict with carriageway widening for new raised crossing.
T630	Fagus sylvatica Common Beech	B2	Direct conflict with carriageway widening for new raised crossing.
T631	Fagus sylvatica Common Beech	A2	Direct conflict with carriageway widening and new raised crossing.
T641	Sorbus aucuparia Rowan	A2	Direct conflict with new alignment of the shared path and reallocated grass verge.
T642	Sorbus aucuparia Rowan	A2	Direct conflict with new alignment of the shared path and reallocated grass verge.
T643	Sorbus aucuparia Rowan	C2	Direct conflict with new alignment of the shared path and reallocated grass verge.
Kill Section	1		
T753	Carpinus betulus Hornbeam	A2	Direct conflict with alignment of new bidirectional cycle path.
T755 – T757	Carpinus betulus Hornbeam (x 3)	A2	Three trees in direct conflict with alignment of new bidirectional cycle path
T767 – T769	Carpinus betulus Hornbeam (x 3)	A2	Three trees in direct conflict with alignment of new bidirectional cycle path
T770	Carpinus betulus Hornbeam	A2	Direct conflict with alignment of new bidirectional cycle path.
T771	Carpinus betulus Hornbeam	A2	Direct conflict with alignment of new carriageway.
T772	Carpinus betulus Hornbeam	A2	Direct conflict with alignment of new bidirectional cycle path.
T785	Acer pseudoplatanus Sycamore	B2	Direct conflict with new shared path alignment.

In total 17 trees or 7% of the total surveyed tree population will be lost to facilitate the construction of the proposed cycle scheme.

 9 category A trees (8% of the total CAT A) will be removed, 2 category B (2% of the total CAT B) and 2 category C tree (6% of the total CAT C).

4.2. Additional Tree Loss

4.2.1. In the eastern end of Johnstown village there is a line of lime and ash trees. The trees are established in a narrow grass verge alongside where the land use changes to improved agricultural grazing. The lime trees are good quality and have the potential to mature and enhance the landscape. The ash trees are generally of a lower quality and their crowns are competing with the lime trees, suppressing their canopy development. It is recommended that ten of the ash trees are removed to allow the lime trees to develop freely. Out of the ten ash trees suggested for removal eight are category C and two are category B. Their tree numbers are specified in the tree works schedule in appendix 4 of this report.

4.3. Tree Pruning to Facilitate Development

- 4.3.1. Preconstruction phase tree pruning is not essential, however prior to the opening of the cycle scheme for public usage some tree safety issues will need to be addressed. Outside of the Kill GAA Club there are seven mature trees which have over extended limbs and deadwood accumulating in their crowns. It is recommended that the overextended limbs are shortened to reduce end weight and reduce the risk of failure. The crowns will also need to be cleaned of deadwood to prevent any potential conflicts with the new cycle path.
- 4.3.2. The cycle path will be constructed in close proximity to established trees along the route. It is recommended that a pre public usage tree inspection is carried out to assess headroom along the route and any post construction damage that may have introduced new defects to the retained trees.

4.4. Construction Activities & The Retained Trees

- 4.4.1. In total two hundred and twenty-two trees will be retained along the cycle route. The majority of these trees have the potential to be negatively impacted upon during the construction phase. To mitigate against any potential negative impacts the retained trees will be protected by barrier fencing during the construction phase. It is acknowledged that the fencing specification detailed in BS 5837 will not be practical to install along the route. The restricted space between the existing pavements and grass verges will limit the use of 2 m weld mesh fencing panels. An alternative fencing specification has been suggested in the arboricultural method statement in appendix 1 of this report.
- 4.4.2. There are twelve mature/late mature trees established in the grass verge outside of the Kill GAA club. The new proposed footpath alignment will encroach on the RPAs of the retained trees. It is suggested that a no-dig cellular confinement system with

porous asphalt is installed along this section to mitigate against any potential root severance from digging operations. The specific area is detailed with hatch on the tree removal and protection plan (TS_TPP_16_2_22, sheet 3). Some ground preparations are expected in the area. The ground preparations should ideally be carried out with an air spade/lance to prevent damage to the tree root systems.

4.5. Replacement Tree Planting

- 4.5.1. Seventeen trees will be lost to facilitate the development of the cycle scheme. It is suggested that seventeen new trees are established in suitable locations along the route post construction.
- 4.5.2. If the ten ash trees described in paragraph 4.2.1 of this report are removed the recommendation is that they are not replaced.

5. CONCLUSIONS

- The tree loss to facilitate the construction of the proposed scheme is not considered significant. Ninety three percent of the surveyed population will be retained.
- Significant effort has been made by the scheme designers to design a route that will retain as many trees as possible.
- The retained trees will be protected by barrier fencing during the construction phase.
- There is adequate space to compensate for the tree loss and establish new trees post construction.
- The arboricultural method statement in appendix 1 of this report addresses the following: preconstruction tree works, tree protective fencing, root management and construction phase monitoring and compliance.

Appendix 1

Arboricultural Method Statement

The following arboricultural method statement outlines the order of works and tree protection measures for the Naas to Kill Cycle Scheme. The method statement should be read in conjunction with the Tree Removal & Protection Plans (TS TPP 16 2 22, sheets 1-5).

Pre-Construction Site Briefing

- Prior to the construction phase of the development a briefing should be arranged between the principal contractor and the retained consulting arborist. The objectives of the briefing will be to clarify the following:
 - Confirm the tree works to be undertaken.
 - Confirm the location of the tree protection fencing.
 - Review and raise awareness of sensitive areas on the site where mature trees and hedges are being retained.
 - Confirm the requirements for arboricultural monitoring for the duration of the construction phase.

Pre-Construction Tree Works

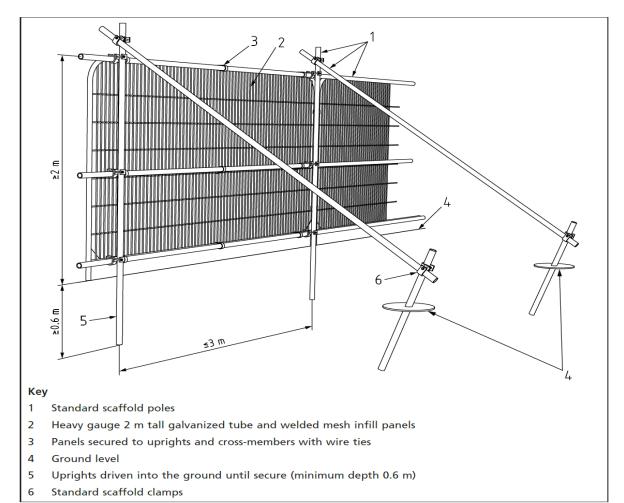

- The necessary tree works to facilitate the proposed development are described in the tree works schedule (appendix 4 of this report).
- The tree works schedule should be presented to the tree owner prior to any work being carried out. The tree owner must agree to the proposed works.
- All tree works will be carried out in accordance with the recommendations given in BS 3998 (2010).
- Prior to the commencement of any tree works, the trees and their surroundings should be assessed for the presence of any seasonal nesting sites, potential roost features or protected species.

Protective Fencing

- The tree protection fencing is designed to create a construction exclusion zone around the retained trees to protect the critical root mass from negative impacts.
- The alignment of the tree protection fencing largely follows the perimeter of the
 existing grass verges in sections along the route. The layout of the fencing should
 resemble what is detailed in the tree protection plans (TS_TPP_16_2_22, sheets 1-5)
- The tree protection fencing should be fit for purpose and well braced to resist impacts. It is acknowledged that the fencing configuration detailed in the British Standard (see image on the following page) would be impractical to install along the route. Two alternative fencing types have been provided.
- Signs will be erected on the fences stating 'CONSTRUCTION EXCLUSION ZONE NO ACCESS'.

The main contractor will inform the client that the tree protection fencing, and signage is in place before construction activities commence.

BS 5837 British Standard Tree Protection Fencing:

ALTERNATIVE FENCING

Roots & Root Pruning

- It is possible that tree roots may be encountered when ground works begin along the route. It is recommended that rolls of hessian/jute are stored on site so that any exposed roots can be protected from drying out and desiccation occurring.
- Where tree roots are encountered in the working areas and cannot be moved out of the construction profile root pruning may be required. If root pruning is necessary, it should be carried out by a qualified arborist. The roots should be target pruned with a sharp secateurs or handsaw. Once pruning is complete the cut ends should be recovered with topsoil or hessian.

Monitoring & Compliance

- It is recommended that a qualified consulting arborist is assigned to the project for the duration of the construction phase.
- The responsibilities of the assigned arborist will include:
 - Bi-weekly checks on the tree protective fencing.
 - o Monitoring the health and vitality of the retained trees.
 - o Monitoring soil disturbance and root disturbance in the working areas.
 - Carry out any potential root pruning operations if necessary.

Appendix 2

Tree Schedule Key

Tree/Group number Reference number for individual trees or groups of trees, prefixed by T

(Tree), TG (Tree Group), W (Woodland), H (Hedge) or S (Shrub) to indicate

the type of feature

Tree Count Number of trees of a particular species recorded within a group feature,

with the default value of 1 for single trees.

Species Scientific name followed by common name

Height (m)Tree height to the nearest metre, measured with a Haglofs Clinometer or

estimated.

Stem Count Number of stems. Stem count indicates whether the tree is single-stemmed

or multi-stemmed and informs the RPA calculation.

Stem Diameter Stem diameter measured at 1.5m above ground level in accordance with

Annex C of BS5837:2012.

Crown Spread Distance from the stem position to the crown periphery in the four cardinal

directions.

First Significant
Branch Height (m) –
Direction of growth

Distance between the ground and lowest significant branch and the

direction of growth.

Canopy Clearance Height (m) Distance between the ground and the lowest point of the crown periphery,

estimated to the nearest half metre.

Life-stage Young, Semi-mature, Early-mature, Mature, Late Mature, Ancient or Veteran

Physiological Condition

Good, Normal, Fair, Poor, Dead

Observations General description of the tree or tree group, including basic features and

morphology, structural and physiological condition, growing conditions and

surroundings.

Recommendations Management recommendations for tree works to address immediate

unacceptable risks, or to facilitate development proposals.

Estimated Remaining Contribution (years)

Estimated number of years for which the tree will continue to make a positive contribution to the site, banded as <10yrs, 10-20yrs, 20-40yrs, 40+.

Retention Category Quality and value category as defined in table 1 of BS5837:2012 (see

following page for full description)

Retention Subcategory One or more sub-categories as defined in table 1 of BS5837:2012 (see

following page for full description)

RPR (m) Radius of the RPA, in metres, when this is plotted as a circle around the tree

stem

RPA (m³) Root protection area calculated from the stem diameter according to the

formula in BS5837:2012. The RPA is the minimum area required to maintain

tree viability.

Table 1 Cascade chart for tree quality assessment

Category and definition	Criteria (including subcategories where a	ppropriate)		ldentification on plan								
Trees unsuitable for retention	(see Note)											
Category U Those in such a condition	 Trees that have a serious, irremediable, structural defect, such that their early loss is expected due to collapse, including those that will become unviable after removal of other category U trees (e.g. where, for whatever reason, the loss of companion shelter cannot be mitigated by pruning) 											
that they cannot realistically be retained as living trees in	Trees that are dead or are showing signs of significant, immediate, and irreversible overall decline											
the context of the current land use for longer than 10 years	 Trees infected with pathogens of significance to the health and/or safety of other trees nearby, or very low quality trees suppressing adjacent trees of better quality 											
To years	NOTE Category U trees can have existing see 4.5.7.	g or potential conservation value which it mig	ght be desirable to preserve;									
	1 Mainly arboricultural qualities	2 Mainly landscape qualities	3 Mainly cultural values, including conservation									
Trees to be considered for rete	ention											
Category A Trees of high quality with an estimated remaining life expectancy of at least 40 years	Trees that are particularly good examples of their species, especially if rare or unusual; or those that are essential components of groups or formal or semi-formal arboricultural features (e.g. the dominant and/or principal trees within an avenue)	Trees, groups or woodlands of particular visual importance as arboricultural and/or landscape features	Trees, groups or woodlands of significant conservation, historical, commemorative or other value (e.g. veteran trees or wood-pasture)	See Table 2								
Category B Trees of moderate quality with an estimated remaining life expectancy of at least 20 years	Trees that might be included in category A, but are downgraded because of impaired condition (e.g. presence of significant though remediable defects, including unsympathetic past management and storm damage), such that they are unlikely to be suitable for retention for beyond 40 years; or trees lacking the special quality necessary to merit the category A designation	Trees present in numbers, usually growing as groups or woodlands, such that they attract a higher collective rating than they might as individuals; or trees occurring as collectives but situated so as to make little visual contribution to the wider locality	Trees with material conservation or other cultural value	See Table 2								
Category C Trees of low quality with an estimated remaining life expectancy of at least 10 years, or young trees with a stem diameter below 150 mm	Unremarkable trees of very limited merit or such impaired condition that they do not qualify in higher categories	Trees present in groups or woodlands, but without this conferring on them significantly greater collective landscape value; and/or trees offering low or only temporary/transient landscape benefits	Trees with no material conservation or other cultural value	See Table 2

Naas to Kill Cycle Scheme Tree Works Schedule										
Tree No	Tree Species	CAT <i>BS5837</i>	Description of Tree Works							
Johnstown Section preconstruction tree removals										
T629	Fagus sylvatica Common Beech	C2	Fell at ground level.							
Т630	Fagus sylvatica Common Beech	В2	Fell at ground level.							
T631	Fagus sylvatica Common Beech	A2	Fell at ground level.							
T641	<i>Sorbus aucuparia</i> Rowan	A2	Fell at ground level.							
T642	Sorbus aucuparia Rowan	A2	Fell at ground level.							
T643	Sorbus aucuparia Rowan	C2	Fell at ground level.							
Kill Sect	Kill Section preconstruction tree removals									
T753	Carpinus betulus Hornbeam	A2	Fell at ground level							
T755 – T757	Carpinus betulus Hornbeam (x 3)	A2	Fell 3 x trees at ground level							
T767 – T769	Carpinus betulus Hornbeam (x 3)	A2	Fell 3 x trees at ground level							
T770	Carpinus betulus Hornbeam	A2	Fell at ground level.							
T771	Carpinus betulus Hornbeam	A2	Fell at ground level.							
T772	Carpinus betulus Hornbeam	A2	Fell at ground level.							
T785	Acer pseudoplatanus Sycamore	В2	Fell at ground level.							
Ash removals in Johnstown to release the retained limes from canopy competition										
T652	Fraxinus excelsior Ash	B2	Fell at ground level and grind stump.							
T654	Fraxinus excelsior Ash	B2	Fell at ground level and grind stump.							
T655	Fraxinus excelsior Ash	C2	Fell at ground level and grind stump.							
T656	Fraxinus excelsior Ash	C2	Fell at ground level and grind stump.							
T658	Fraxinus excelsior Ash	C2	Fell at ground level and grind stump.							

Naas to Kill Cycle Scheme Tree Works Schedule

Tree No	Tree Species		Description of Tree Works					
T660	Fraxinus excelsior Ash	C2	Fell at ground level and grind stump.					
T662	Fraxinus excelsior Ash	C2	Fell at ground level and grind stump.					
T665	<i>Fraxinus excelsior</i> Ash	C2	Fell at ground level and grind stump.					
T668	<i>Fraxinus excelsior</i> Ash	C2	Fell at ground level and grind stump.					
T671	<i>Fraxinus excelsior</i> Ash	C2	Fell at ground level and grind stump.					
Further recommended tree works to be carried out prior to public usage of the cycle path.								
T689	Fraxinus excelsior Ash	C2	Remove the eastern stem leaning towards the car park. The western stem with the tree tag is OK.					
T690	Fraxinus excelsior Ash	C2	Clean crown of deadwood and any defective branches.					
T691	<i>Fraxinus excelsior</i> Ash	B2	Reduce end weight on over extended limbs over the carpark by 10-15%. Clean crown of deadwood and any defective branches.					
T692	<i>Fraxinus excelsior</i> Ash	B2	Reduce end weight on over extended limbs over the road and carpark by 10-15%. Clean crown of deadwood and any defective branches.					
Т693	Fraxinus excelsior Ash	B2	Reduce end weight on over extended limbs over the carpark by 10-15%. Clean crown of deadwood and any defective branches.					
T694	Fraxinus excelsior Ash	B2	Clean crown of deadwood and any defective branches.					
T695	Fraxinus excelsior Ash	B2	Clean crown of deadwood and any defective branches.
